The Clinical Practice of Interventional Radiology: Good Medicine and Good Business

Longitudinal Care
Beyond performing minimally invasive procedures, interventional radiologists also provide longitudinal patient care — before, during and after treatment.

As active participants in both acute and outpatient settings, IR physicians provide treatment plans and follow up with patients and other physicians to monitor health and outcomes.

Achieve the Triple Aim
- Improve the patient care experience — including quality and safety
- Reduce the per capita cost of health care
- Improve the health of populations
Improved Patient Experience Aim

- Shorter recovery times
- Reduced risk
- Better outcomes

RS Is Modern Medicine

Interventional radiology (IR) specializes in the minimally invasive treatment of medical conditions that once required open surgery and longer-term hospital admissions. IR physicians are integral members of patient care teams, performing in the front lines of clinical advances and procedural care.

Integrated Care Teams

- Improved Patient Experience
- Less hospital stays
- Less invasive procedures
- Less cost
- Less risk

Essentially, a clinical interventional radiology practice benefits hospitals, health systems and medical groups through efficient and value-added procedures. Less-invasive IR procedures allow you to shift care to less expensive outpatient settings and increase patient throughput.

Less Is More

- Essentially, a clinical interventional radiology practice benefits hospitals, health systems and medical groups through efficient and value-added procedures. Less-invasive IR procedures allow you to shift care to less expensive outpatient settings and increase patient throughput.

Interventional radiologists are on the front lines of clinical advances and procedural care — promoting innovation and breaking down silos of specialty departments. They forge relationships with physicians who are trained in both diagnostic imaging and minimally invasive interventions. The use of the latest image-guided technologies allows them to treat patient medical conditions with less risk and expense.
